

PIN Board Solar Luminaires

Solar street light luminaires in two variations

The popular [PIN board series](#) is available as a Solar street light version with a motion sensor in two styles. The PIN board light 4S basic is identical in design to the S series. In addition, it is equipped with a battery and solar panel.

All system components are exchangeable and replaceable with a newer LED technology according to the FuturePROOF principle. The areas of application of the PIN board Solar light are greatly varied. These luminaires are ideal for street lighting, car parks, residential complexes, district lighting, and much more.

The PIN board light is available in two different performance classes, which also differ visually in their color design – *basic* and *executive*.

The *basic* version is based on a 265 W module. The mast is hot-dip galvanized and unpainted, the battery box is made of stainless steel.

The *executive* version is based on a 285 W module. The mast and the battery box are painted white. The luminaire can optionally be equipped with a motion detector and/or camera.
