

OptimaLine2

Powerful floodlight for any large areas

The OptimaLine series is suitable for retrofitting or lighting large areas such as aircraft hangars, track lighting, port facilities, but also as a floodlight for sports fields. These high-performance LEDs with 2 COBs offer maximum flexibility with freely selectable symmetrical optics. At up to 160 W, it achieves a remarkable light output with a full 22,000 lumens. Another advantage is the short conversion times because existing mast systems can still be used.

The OptimaLine is available in two designs: As an FU floodlight with special foiling on the entire inner surface and as a reflector variant with relatively focused light. At the customer's request, the series can be equipped with an individual radio control system with switching and dimming functions, which avoids the need to lay new control cables.

Also available with active cooling

Depending on the location and desired light output, the OptimaLine can be supplied as an AC version with active cooling. Ask our technicians about the best solution for you!
