

BigTAB-LED-Module 2

The BigTAB LED module was specially developed for the illumination of large areas and for maximum light output. This makes the BigTAB suitable for both hall lighting and large outdoor areas. Depending on the lighting requirements or customer requirements, these LED modules can be assembled individually in clusters.

Light color, color rendering (CRI), beam angle, and illuminance can be freely selected. UV-resistant, high-performance lenses and the integrated ThermoProtect system enable peak outputs of up to 600 W at 57 klm. In addition, BigTab modules are insensitive to vibration, extremely resistant and withstand ambient temperatures from -30 C° to +45 C°. They can be installed in halls with high ceiling heights of up to 50m. Thus, BigTAB modules offer a maximum of flexibility in the interior lighting of large areas such as halls, warehouses, etc., but are also ideally suited for outdoor lighting.

On request, presence control, dimming function, daylight-dependent control can be provided.
